Do not sell to suppliers. Land the buyer.

Selling factoring supplier by supplier is a treadmill: high acquisition cost, small tickets, no network effect. So we invert it. One investment-grade buyer's supplier network is the distribution channel, and the buyer costs nothing to serve. This is the single decision the whole go-to-market rests on.

01 The motion: buyer-led supply-chain finance

Land one anchor buyer. Onboard its supplier tail. Bring one or two financiers to compete for that paper. Suppliers arrive pre-qualified, because their receivable is already buyer-approved, which is exactly the precondition our model needs. The first deal is closeable because all three sides gain at the same moment:

ANCHOR BUYER

Pays nothing

A healthier supply chain at zero cost. It still pays face value at maturity, to whoever holds the receivable, and never sees the pricing.

SUPPLIER

Cheaper, quiet cash

Same-day liquidity at a confidential price. No distress signal leaks to the buyer, so the commercial relationship is not repriced.

FINANCIER (PAYS US)

De-risked flow

Pre-underwritten paper it cannot double-fund, at a lower loss ratio and lower underwriting cost.

02 Unit economics, from the live demo

ONE INVOICE, 60 DAY TENOR

$100,000	$98,030	$1,970	~12%
invoice face value	advanced to supplier, today	financier spread at 1.97%	annualised to the financier

We take a few bps of financed volume, a slice of that discount, and/or SaaS for the AI underwriting workstation. We sit in the flow of funds, and we lower the financier's loss ratio (double pledging is impossible) and underwriting cost (the agent), so we capture part of the value we create. An optional supplier origination fee is a secondary line.

Illustrative only, not a forecast: at 25 bps of financed volume, a financier running a $50M annual receivables book generates about $125k of revenue for us. We have no book and no signed financier yet, so treat this as the shape of the model, not a projection.

03 Why now

- Higher rates and tighter credit have increased demand for monetising receivables.
- Privacy-preserving institutional rails are finally practical: Canton plus the CIP-0056 token standard.
- Duplicate pledging is a standing, unsolved pain that shared-state verification actually fixes, rather than reports after the fact.

04 The sequence

01 **Sandbox pilot** 2 to 4 weeks

One buyer, three suppliers, one financier on a Canton validator. Run 10 to 20 anonymized real invoices through create, finance and settle.

Passes only if: the buyer's node never receives the margin; a double-pledge attempt is rejected on-ledger; the financier signs off on the AI rate recommendations.

02 **Limited production** 6 to 8 weeks

Connect the financier's real cash rail (token-standard DvP or a fiat PSP bridge). Go live with a capped book of $2M to $5M.

Targets: advance in under one business day; zero double-pledge losses.

03 **Scale into a marketplace** after

Add a second competing financier, which is what turns on Veild, our sealed-bid mode: suppliers shop the receivable and no financier sees a rival's price. Then supplier self-onboarding, then cross-border, where confidentiality and atomic settlement matter most, then adjacent products such as PO finance and dynamic discounting.

05 Channels: where we actually reach them

These buyers are not on crypto Twitter. They are reachable through the trade-finance industry itself.

INDUSTRY BODIES	FCI (Factors Chain International), ICC, BAFT, ITFA.
EVENTS	SIBOS, GTR conferences, Supply Chain Finance Community.
PRESS	Trade Finance Global, Global Trade Review, ICC publications.
INSIDE A BANK	Receivables and factoring desks, treasury and working-capital teams, innovation groups.
CANTON-NATIVE	Our first counterparty is likely already on Canton. Institutional tokenization is arriving (Zeconomy as validator, Bitwave as Super Validator), so we ride an existing institutional relationship instead of acquiring SMEs cold.

06 Beachhead

Manufacturing and logistics first: long DSO, concentrated investment-grade buyers, high invoice values, and genuine exposure to duplicate-assignment loss. That is where confidentiality and structural uniqueness are worth paying for. We deliberately skip micro-SMEs with one-off invoices, retail credit, and anyone whose pricing is already public, because the product creates no value there.

07 Honest state, and the next three moves

No design partner is signed, no pilot has run, and there is no book. The go-to-market above is a plan, not a report. The next three concrete actions, in order:

- One **financier design-partner conversation** (specialty finance or a bank receivables desk). They are the payer, so they come first.
- One **anchor buyer introduction**, through that financier's existing book rather than cold.
- Run the **sandbox pilot criteria** against real anonymized invoices, and publish whether it passed or failed.

The product is already live and provable, so the bottleneck is not engineering. It is one financier saying yes.
